WildfirePINN research endpoint

This is an experimental research forecast. It is not an operational wildfire service. Coordinates are meters, not longitude and latitude. The default model is a numerical hybrid named `ray_inverse_solver`.

1. Sign in to the Google account that was granted access.
2. Open Google Cloud Console and select project wildfirepinn.
3. Go to Agent Platform → Models → Model Registry.
4. Open wildfirepinn-research-v1-1.
5. Open the Deploy & test tab.
6. Replace everything in the JSON box with the request below.
7. Click Infer.

```
{
  "instances": [
    {

          "time_s": 200,
          "perimeter": {
            "type": "Polygon",
            "coordinates": [[[90, 0], [63.64, 63.64], [0, 90], [-63.64, 63.64], [-90, 0], [-63.64, -63.64],
[0, -90], [63.64, -63.64], [90, 0]]]
          }
        },
        {
```

```
        "time_s": 400,
        "perimeter": {
          "type": "Polygon",
          "coordinates": [[[100, 0], [70.71, 70.71], [0, 100], [-70.71, 70.71], [-100, 0], [-70.71,
-70.71], [0, -100], [70.71, -70.71], [100, 0]]]
        }
       }
     ],
     "forecast_time_s": 600
   }
  ]
}
```

The response appears on the right. A successful call has `predictions`, `model_id` `ray_inverse_solver`, `forecast_time_s` 600, a `Polygon` perimeter, and a positive `burned_area_m2`. `operational_wildfire_service` is false.

The three polygons are a synthetic fire in local meters at 0 s, 200 s, and 400 s. The service forecasts the perimeter at 600 s. To forecast another fire, replace those rings with your own closed polygons in meters. The first and last point of each ring must be the same point.

If the page says you do not have permission, your Google account still needs the Vertex AI User role on project `wildfirepinn`.
